

Azure Storage Account Creation: An Azure Storage Account was provisioned within a dedicated Resource Group. This step involved selecting a globally unique name, defining the region, and configuring redundancy (e.g., Locally-Redundant Storage - LRS) and access tier settings to meet assignment requirements.

Security

Configure security settings that impact your storage account.

Require secure transfer for REST API operations

☒

Allow enabling anonymous access on individual containers

☐

Enable storage account key access

☒

Default to Microsoft Entra authorization in the Azure portal

☐

Minimum TLS version

Version 1.2

Permitted scope for copy operations

From any storage account

Hierarchical Namespace

Hierarchical namespace, complemented by Data Lake Storage Gen2 endpoint, enables file and directory semantics, accelerates big data analytics workloads, and enables access control lists (ACLs). [Learn more](#)

Enable hierarchical namespace

☒

Access protocols

Blob and Data Lake Gen2 endpoints are provisioned by default. [Learn more](#)

Enable SFTP

☐

Enable network file system v3

☐

The current combination of storage account kind, performance, replication, and location does not support the NFS v3 feature. [Learn more about NFS v3](#)

Blob storage

Blob storage

Allow cross-tenant replication

☐

Cross-tenant replication and hierarchical namespace cannot be enabled simultaneously.

Access tier

Hot

Optimized for frequently accessed data and everyday usage scenarios

☒

Cool

Optimized for infrequently accessed data and backup scenarios

☐

Cold

Optimized for rarely accessed data and backup scenarios

☐

Azure Files

Enable Managed Identity for SMB

☐

Container Creation: Within the newly created storage account, a container was created. This container serves as a logical grouping for storing blobs (files). The public access level for the container was configured (e.g., private) to control data accessibility.

File Upload: A test file was successfully uploaded to the container, verifying the operational status of the storage service and demonstrating the ability to store data as blobs.

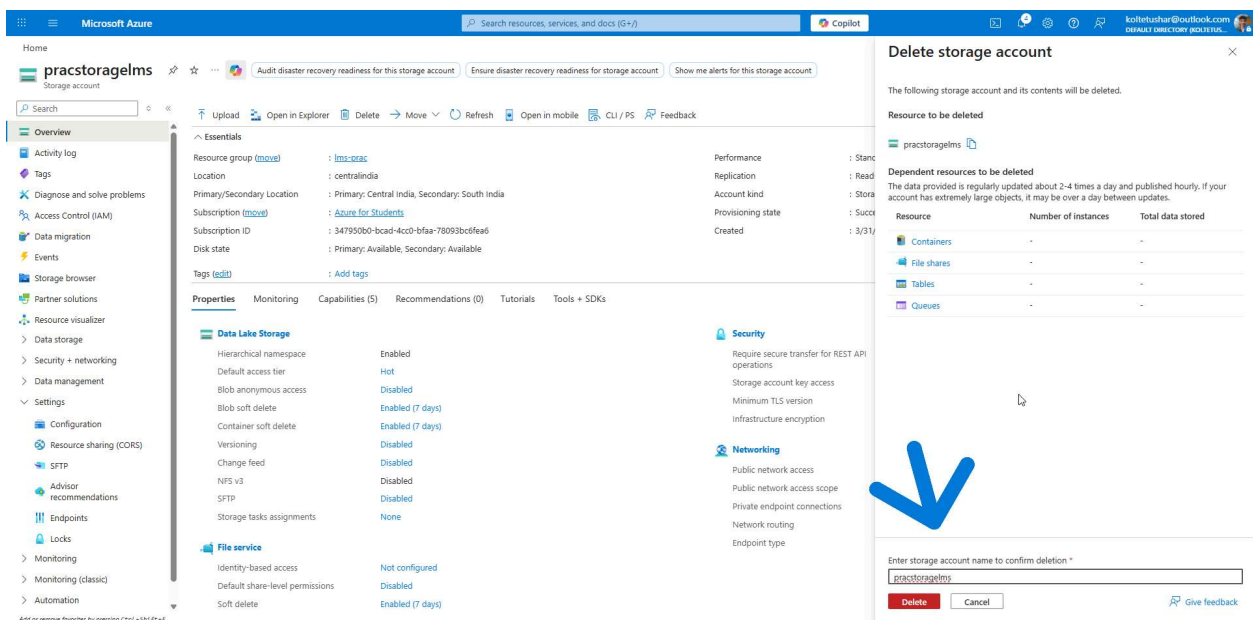

Resource Decommissioning: Upon successful completion of the primary task, all provisioned resources were systematically decommissioned to avoid unnecessary charges. This involved:

Deletion of the Azure Storage Account, which permanently removes all contained data.

Subsequent deletion of the dedicated Resource Group, ensuring complete cleanup of the entire deployment environment.
