

Write a SQL query using the serverless SQL pool in Synapse to read data from a CSV file stored in ADLS without loading it into the Synapse dedicated pool.

The screenshot shows the Microsoft Azure Synapse Analytics interface. The top navigation bar includes "Microsoft Azure", "Synapse Analytics", and the workspace name "sparkpracmod". The left sidebar shows the "Develop" section with a search bar and a list of resources: "SQL scripts" (1) and "Notebooks" (1). The main editor displays a SQL script for "SQL script 1". The script uses `OPENROWSET` to read data from a CSV file in ADLS. The results are shown in a table view with columns C1, C2, and C3. The status bar at the bottom indicates "000009 Query executed successfully."

```
1 SELECT *
2 FROM OPENROWSET(
3     BULK 'https://storageforlmsdemo.dfs.core.windows.net/data/orders1.csv',
4     FORMAT = 'CSV',
5     PARSE_VERSION = '2.0',
6     FIRSTROW = 2
7 ) AS [result];
```

Results

C1	C2	C3
101	1	250
102	2	450
103	3	300

000009 Query executed successfully.
