

Use SQL Variable in OPENROWSET function in Azure Synapse Analytics

The screenshot shows the Microsoft Azure Synapse Analytics interface. The top bar indicates the user is logged in as 'kollitushar@outlook.com'. The left sidebar shows the 'Develop' environment with a search bar and a list of SQL scripts. The main editor displays a SQL script named 'SQL script 1' with the following code:

```
1 DECLARE @path VARCHAR(500)
2 DECLARE @sql VARCHAR(MAX)
3 SET @path = 'https://mylakeforlms8.dfs.core.windows.net/data/orders1.csv'
4 SET @sql = 'SELECT * FROM OPENROWSET(
5     BULK' + @path + ',
6     FORMAT = ''CSV'',
7     HEADER_ROW = TRUE,
8     PARSER_VERSION = ''2.0''
9 ) as results'
10 EXEC(@sql)
```

The script is executed, and the results are displayed in a table view. The table has three columns: OrderID, CustomerID, and Amount. The results are as follows:

OrderID	CustomerID	Amount
101	1	250
102	2	450
103	3	300

The bottom status bar shows a message: '0000:05 Query executed successfully.'
