

A cloud-native data engineering pipeline that incrementally ingests CSV ramen-ratings data from Azure Data Lake Storage, transforms it through a Medallion Architecture (Bronze → Silver → Gold), and produces analytics-ready Delta tables — all orchestrated via a daily Databricks Workflow.

01 · Ingestion

Databricks Auto Loader reads only newly uploaded CSVs from ADLS using checkpoint state. Cleans invalid column names and writes to the Bronze Delta table.

02 · Transformation

PySpark job drops unrated records, casts stars to numeric, and adds derived columns: rating category (Excellent / Good / Average) and a premium ramen flag.

03 · Analytics

Aggregates Silver data into Gold tables: country-wise average ratings, top-rated brands, and noodle-style analysis.
